## REBUILD ANFO/MMU MIX UNIT

The GBB PROGRAM allows you to achieve maximum utilization of your original investment and experience the meaning of “QUALITY REBORN” for your ANFO, Pumper and Blend

The craftsmen of the GBB REBUILD department take exceptional pride in how their workmanship transforms your aged bulk truck into a unit that will perform on the bench with the reliability as if it were new.

Each truck to be remanufactured is thoroughly inspected to establish condition and usability of the existing tanks, augers, housings and assemblies, and then those core components are totally refurbished and prepared to be remounted. Then, to ensure operational performance, all new pumps, motors, valves, wiring, plumbing, hoses and upgraded optional control systems to GBB Xblast are configured and installed.

To further extend the life of your rebuilt bulk truck, many companies have elected to invest in a new or more current used chassis for the remounting of the remanufactured unit. And as an added service, GBB has the facilities, paint booth and equipment to professionally prepare and repaint your existing, late model or new chassis to the original color or color of your choice. New chassis or repainted used chassis – the finished product has the look of a new bulk truck that proudly projects your company image.

The REMANUFACTURED truck is not complete until all safety equipment is upgraded to conform with the current standards, tanks are certified; and the bulk truck is then recertified to meet all applicable geographic
